## Applications

- Chemical Processing Liquids
- Food Processing Liquids
- Potable Water
- Cooling Water
- Condensate Return
- Industrial Wastewater
- Mildly Corrosive Liquids
- Crude Oil \& Gas
- Produced Water
- Saltwater
- $\mathrm{CO}_{2}$

## Materials and Construction

All pipe is filament wound with continuous strands of glass filaments saturated with amine-cured epoxy thermosetting resin. The pipe wall includes an internal resin-rich corrosion barrier. The pipe is designed in accordance with API 15 LR at $200^{\circ} \mathrm{F}\left(93^{\circ} \mathrm{C}\right)$, serviceable up to $210^{\circ} \mathrm{F}\left(99^{\circ} \mathrm{C}\right)$ by applying a derating factor of 0.92 to all component ratings. The pressure rating is 362 psig (25 Bar) for a hydrostatic design life of 20 years per ASTM D2992 Procedure B. For 2"-6" (50-150 $\mathrm{mm})$ sizes, the matched tapered joining method is used and the pipe is available in random 30 foot ( 9.14 meter) lengths. For $8^{\prime \prime}-24^{\prime \prime}(200-600 \mathrm{~mm})$ sizes, the matched tapered joining method is used and the pipe is available in random 40 foot ( 12 meter) lengths. Pipe is supplied with one end belled (integral bell orfactory-bonded coupling) and one end tapered.

ASTM D-2996 Classification: RTRP-11AW1-3110 forstatic design basis.

## Fittings

Fittings are manufactured with the same chemical/temperature capabilities as the pipe. Depending on the configurations and size, the fittings construction method will be compression molded, contact molded, fabricated or filament wound.

## Joining System

- T.A.B. ${ }^{\text {TM }}$ - In sizes 2 " -6 ", pipe and couplings are supplied with a threaded and bonded (T. A. B) joining system. Double-lead threads provide quick secure adhesive connections during installation.
- Bell \& Spigot - The pipe and fittings are joined using the bell and spigot connection. Pipe is supplied with one end belled (integral bell orfactory-bonded coupling) and one end tapered in sizes 8"-24". For $8^{\prime \prime}-24$ " sizes, the matched tapered joining method is used and the pipe is available in random 12 meter ( 40 feet) lengths.

Epoxy adhesive is used to secure the joint. When properly installed, the system will operate at the maximum pressure rating of the pipe.

- Flanged - Flanged connections are available for all components and diameters.

т.A.B.

Bell \& Spigot

Flanged

Nominal Dimensional Data

| Pip |  | Inside Diameter |  | Outside Diameter ${ }^{(2)}$ |  | Reinforced Wall Thickness ${ }^{(1)}$ |  | Weight |  | Capacity |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| in | mm | in | mm | in | mm | in | mm | lbs/ft | kg/m | gal/ft | 1/m |
| $2^{(1)}$ | 50 | 2.24 | 57 | 2.35 | 60 | 0.058 | 1.5 | 0.4 | 0.7 | 0.2 | 2.5 |
| $3^{(1)}$ | 80 | 3.36 | 85 | 3.54 | 90 | 0.086 | 2.2 | 0.8 | 1.2 | 0.5 | 5.7 |
| 4 | 100 | 4.36 | 111 | 4.53 | 115 | 0.083 | 2.1 | 1.0 | 1.5 | 0.8 | 9.7 |
| 6 | 150 | 6.40 | 163 | 6.65 | 169 | 0.122 | 3.1 | 2.2 | 3.2 | 1.7 | 20.9 |
| 8 | 200 | 8.36 | 212 | 8.68 | 221 | 0.164 | 4.2 | 3.8 | 5.6 | 2.9 | 35.4 |
| 10 | 250 | 10.36 | 263 | 10.76 | 273 | 0.203 | 5.2 | 5.8 | 8.7 | 4.4 | 54.4 |
| 12 | 300 | 12.28 | 312 | 12.76 | 324 | 0.241 | 6.1 | 8.2 | 12.2 | 6.2 | 76.4 |
| 14 | 350 | 14.03 | 356 | 14.58 | 370 | 0.275 | 7.0 | 10.7 | 15.9 | 8.0 | 100.0 |
| 16 | 400 | 16.03 | 407 | 16.66 | 423 | 0.314 | 8.0 | 13.9 | 20.7 | 10.6 | 130.0 |
| 18 | 450 | 17.83 | 453 | 18.54 | 471 | 0.357 | 9.1 | 17.6 | 26.2 | 13.0 | 161.0 |
| 20 | 500 | 19.83 | 504 | 20.62 | 524 | 0.397 | 10.1 | 21.8 | 32.4 | 16.0 | 199.0 |
| 24 | 600 | 23.83 | 605 | 24.78 | 629 | 0.477 | 12.1 | 31.5 | 46.9 | 23.2 | 288.0 |

${ }^{(1)}$ Reinforced wall thickness exceeds the requirement for 362 psig and may be operated up to 435 psig.
${ }^{(2)}$ Outer diameter is for use in flexibility analysis. Consult factory representative for pipe OD tolerances.
NOTE: System rating is determined by pressure ratings of fittings used in the piping system. See document CI1370 for individual fitting pressure ratings.

## Supports

The following engineering analysis must be performed to determine the maximum support spacing for the piping system. Proper pipe support spacing depends on the temperature, pressure and weight of the fluid carried in the pipe. The support spacing is calculated using continuous beam equations and the pipe bending modulus derived from long-term beam bending tests. The following tables were developed to ensure a design that limits beam mid-span deflection to $1 / 2$ inch to ensure good appearance and adequate drainage. Any additional weight on the piping system such as insulation or heat tracing requires further consideration. Restrained (anchored) piping systems operating at elevated temperatures often result in guide spacing requirements that are more stringent than simple unrestrained piping systems. In this case, the maximum guide spacing will dictate the support/guide spacing requirements for the system. Pipe support spans at changes in direction require special attention. Supported and unsupported fittings. at changes in direction are considered in the following tables and must be followed to properly design the piping system.

Support Spacing vs. Specific Gravity

| Specific Gravity | 2.00 | 1.50 | 1.25 | 1.00 | 0.75 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Multiplier | 0.85 | 0.91 | 0.95 | 1.00 | 1.06 |

Example: 18 " $(450 \mathrm{~mm})$ pipe @ $75^{\circ} \mathrm{F}\left(24^{\circ} \mathrm{C}\right)$ with 1.5 specific gravity fluid, maximum support spacing $=37.3^{\prime} \times 0.91=33.9 \mathrm{ft}$.

Maximum Support Spacing for Pipe ${ }^{(1)}$

| Size | Continuous Spans of Pipe $^{(2)}$ |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | feet |  | meters $^{\prime}$ |  |  |  |
| in | $\mathbf{m m}$ | $\mathbf{7 5}^{\circ} \mathbf{F}$ | $\mathbf{2 0 0}^{\circ} \mathbf{F}$ | $\mathbf{2 4}^{\circ} \mathbf{C}$ | $\mathbf{9 3}^{\circ} \mathbf{C}$ |
| 2 | 50 | 14.0 | 10.2 | 4.27 | 3.10 |
| 3 | 80 | 17.1 | 12.4 | 5.22 | 3.79 |
| 4 | 100 | 18.2 | 13.2 | 5.56 | 4.03 |
| 6 | 150 | 22.1 | 16.0 | 6.74 | 4.89 |
| 8 | 200 | 25.4 | 18.4 | 7.75 | 5.62 |
| 10 | 250 | 28.3 | 20.5 | 8.63 | 6.25 |
| 12 | 300 | 30.8 | 22.3 | 9.40 | 6.81 |
| 14 | 350 | 32.9 | 23.9 | 10.04 | 7.28 |
| 16 | 400 | 35.2 | 25.5 | 10.74 | 7.78 |
| 18 | 450 | 37.3 | 27.0 | 11.38 | 8.25 |
| 20 | 500 | 39.3 | 28.5 | 12.00 | 8.70 |
| 24 | 600 | 43.1 | 31.3 | 13.15 | 9.53 |

${ }^{(1)}$ For $\mathrm{Sg}=1.0$, consult manufacturer for heavier insulated pipe support spans. Span
recommendations include no provision for weight of (fittings, valves, etc.) or thrusts at branches and turns. Heavy valves and other appurtenances must be supported separately.
${ }^{(2)}$ Calculated spans are based on $1 / 2$ " mid-span deflections to ensure good appearance and adequate drainage. Total system stresses should always be taken into account by the system design engineer when determining support spans.

There are seven basic rules to follow when designing piping system supports, anchors, and guides:

1. Do not exceed the recommended support span.
2. Support valves and heavy in-line equipment independently.

This applies to both vertical and horizontal piping.
3. Protect pipe from external abrasion.
4. Avoid point contact loads
5. Avoid excessive bending. This applies to handling, transporting, initial layout, and final installed position.
6. Avoid excessive vertical run loading. Vertical loads should be supported sufficiently to minimize bending stresses at outlets or changes in direction.
7. Provide adequate axial and lateral restraint to ensure line stability during rapid changes in flow.

Adjustment Factors for Various Spans With Unsupported Fitting at Change in Direction

|  | Span Type | Factor |
| :--- | :--- | :--- |
| LC | Continuous interior or fixed end spans | 1.00 |
| C | Second span from supported end or unsupported fitting | 0.80 |
| A+B | Sum of unsupported spans at fitting | $\leq 0.75^{\star}$ |
| D | Simple supported end span | 0.67 |

*For example: If continuous support is 10 ft . ( 3.04 m ), $\mathrm{A}+\mathrm{B}$ must not exceed 7.5 ft .( 2.28 m ) (A=3 ft. $(0.91 \mathrm{~m})$ and $B=4.5 \mathrm{ft}$. $(1.37 \mathrm{~m})$ ) would satisfy this condition.

Adjustment Factors for Various Spans With Supported Fitting at Change in Direction

|  | Span Type | Factor |
| :--- | :--- | :--- |
| LC | Continuous interior or fixed end spans | 1.00 |
| A | Second span from simple supported end or unsupported fitting | 0.80 |
| B | Simple supported end span | 0.67 |

## Thermal Expansion

The effects of thermal gradients on piping systems may be significant and should be considered in every piping system stress analysis. Pipe line movements due to thermal expansion or contraction may cause
high stresses or even buckle a pipe line if improperly restrained. Several piping system designs are used to manage thermal expansion and contraction in above ground piping systems. They are listed below according to economic preference:

1. Use of inherent flexibility in directional changes.
2. Restraining axial movements and guiding to prevent buckling.
3. Use expansion loops to absorb thermal movements.
4. Use mechanical expansion joints to absorb thermal movements.

To perform a thermal analysis the following information is required:

1. Isometric layout of piping system
2. Physical and material properties of pipe
3. Design temperatures
4. Installation temperature (Final tie in temperature)
5. Terminal equipment load limits
6. Support movements

A comprehensive review of temperature effects on fiberglass pipe may be found in NOV Fiber Glass Systems' Engineering and Piping Design Guide, Section 3.

| Change in <br> Temperature |  | Pipe Change in <br> Length |  |
| :--- | :--- | :--- | :--- |
| ${ }^{\circ} \mathbf{F}$ | ${ }^{\circ} \mathbf{C}$ | in/100 ft | $\mathbf{c m} / \mathbf{1 0 0} \mathbf{~ m}$ |
| 25 | 13.9 | 0.32 | 2.67 |
| 50 | 27.8 | 0.64 | 5.35 |
| 75 | 41.7 | 0.96 | 8.02 |
| 100 | 55.6 | 1.28 | 10.7 |

## Testing

Hydrostatic testing is recommended to evaluate the integrity of all new piping installations. For systems operating below the system rating, a test pressure of 1.5 times the system operating pressure is recommended; however, the maximum test pressure must not exceed 1.3 times the lowest pressure rated fiberglass component in the piping system.
The hydro test pressure should be repeated up to ten cycles from 0 psig to the test pressure to provide a high degree of confidence in the piping system. The final pressurization cycle should be allowed to stabilize for 15-30 minutes, then inspected for leaks. Do not attempt to repair leaks while system is pressurized. The hydro test should be repeated after any re-work is performed.

When hydro testing, open high-point vents (ifused) to prevent entrapment of air in the lines as the system is slowly filled with water, then close the vents and slowly pressurize to the test pressure. Upon completion of hydro test, relieve the pressure on the system slowly, open vents and any drains to allow for complete drainage of the system.

## Water Hammer

Piping systems may be damaged by pressure surges due to water hammer. The use of soft start pumps and slow actuating valves will reduce the magnitude of surge pressures during operation and are highly recommended.

## Typical Mechanical Properties

| Pipe Property | $75^{\circ} \mathrm{F}$ | $24^{\circ} \mathrm{C}$ | $200^{\circ} \mathrm{F}$ | $93^{\circ} \mathrm{C}$ | Method |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | psi | MPa | psi | MPa |  |
| Axial Tensile |  |  |  |  |  |
| Ultimate Stress | 9,530 | 65.7 | 6,585 | 45.4 | ASTM D2105 |
| Modulus of Elasticity | $1.68 \times 10^{6}$ | 11,584 | $1.42 \times 10^{6}$ | 9,791 | ASTM D2105 |
| Poisson's Ratio, $v_{\text {ah }}\left(v_{\text {ha }}\right)^{(1)}$ | 0.35 (0.61) |  |  |  |  |
| Axial Compression |  |  |  |  |  |
| Ultimate Stress | 12,510 | 86.3 | 8,560 | 59.0 | ASTM D695 |
| Modulus of Elasticity | $0.677 \times 10^{6}$ | 4,668 | $0.379 \times 10^{6}$ | 2,613 | ASTM D695 |
| Beam Bending |  |  |  |  |  |
| Modulus of Elasticity (Long Term) | $2.6 \times 10^{6}$ | 17,927 | $0.718 \times 10^{6}$ | 4,951 | ASTM D2925 |
| Hydrostatic Burst |  |  |  |  |  |
| Ultimate Hoop Tensile Stress | 40,150 | 277 | 36,480 | 252 | ASTM D1599 |
| Hydrostatic Hoop Design Stress |  |  |  |  |  |
| Static 20 Year Life LTHS - 95\% LCL | - | - | 18,203-14,689 | 125.5-101.3 | ASTM D2992-Procedure B |
| Static 50 Year Life LTHS -95\% LCL | - | - | 16,788-13,142 | 115.7-90.6 | ASTM D2992-Procedure B |
| Parallel Plate |  |  |  |  |  |
| Hoop Modulus of Elasticity | $3.02 \times 10^{6}$ | 20,822 | - | - | ASTM D2412 |
| Shear Modulus | $1.76 \times 10^{6}$ | 12,135 | $1.63 \times 10^{6}$ | 11,240 | - |

## Typical Physical Properties

| Pipe Property | Value | Value | Method |
| :--- | :--- | :--- | :--- |
| Thermal <br> Conductivity | $0.23 \mathrm{BTU} / \mathrm{hr} \cdot \mathrm{ft} \cdot{ }^{\circ} \mathrm{F}$ | $0.4 \mathrm{~W} / \mathrm{m}^{\circ} \mathrm{C}$ | ASTM D177 |
| Thermal <br> Expansion | $10.7 \times 10^{-6} \mathrm{in} / \mathrm{in} /{ }^{\circ} \mathrm{F}$ | $19.3 \times 10^{-6} \mathrm{~mm} / \mathrm{mm} /{ }^{\circ} \mathrm{C}$ | ASTM D696 |
| Absolute <br> Roughness | 0.00021 in | 0.00053 mm |  |
| Specific Gravity |  | 1.8 | ASTM D792 |

${ }^{(1)} V_{\text {ha }}=$ The ratio of axial strain to hoop strain resulting from stress in the hoop direction.
$V_{\mathrm{ah}}=$ The ratio of hoop strain to axial strain resulting from stress in the axial direction.
${ }^{(2)}$ The differential pressure between internal and external pressure which causes collapse.
${ }^{(3)}$ A 0.67 design factor is recommended for short duration vacuum service. A full vacuum is equal to $14.7 \mathrm{psig}(0.101 \mathrm{MPa})$ differential pressure at sea level.
${ }^{(4)} \mathrm{A} 0.33$ design factor is recommended for sustained (long-term) differential collapse pressure design and operation.
